

<b>Name:</b> Tracey Dee Bringuela	<b>Date Performed:</b> 9/10/24
<b>Course/Section:</b> CPE31S	<b>Date Submitted:</b> 9/10/24
<b>Instructor:</b> Robin Valenzuela	<b>Semester and SY:</b>
<b>Activity 2: SSH Key-Based Authentication and Setting up Git</b>	
<b>1. Objectives:</b> 1.1 Configure remote and local machine to connect via SSH using a KEY instead of using a password 1.2 Create a public key and private key 1.3 Verify connectivity 1.4 Setup Git Repository using local and remote repositories 1.5 Configure and Run ad hoc commands from local machine to remote servers	
<b>Part 1: Discussion</b>  It is assumed that you are already done with the last Activity ( <b>Activity 1: Configure Network using Virtual Machines</b> ). <i>Provide screenshots for each task.</i>  It is also assumed that you have VMs running that you can SSH but requires a password. Our goal is to remotely login through SSH using a key without using a password. In this activity, we create a public and a private key. The private key resides in the local machine while the public key will be pushed to remote machines. Thus, instead of using a password, the local machine can connect automatically using SSH through an authorized key.	
<b>What is ssh-keygen?</b>  Ssh-keygen is a tool for creating new authentication key pairs for SSH. Such key pairs are used for automating logins, single sign-on, and for authenticating hosts.	
<b>SSH Keys and Public Key Authentication</b>  The SSH protocol uses public key cryptography for authenticating hosts and users. The authentication keys, called SSH keys, are created using the keygen program.  SSH introduced public key authentication as a more secure alternative to the older .rhosts authentication. It improved security by avoiding the need to have password stored in files and eliminated the possibility of a compromised server stealing the user's password.  However, SSH keys are authentication credentials just like passwords. Thus, they must be managed somewhat analogously to usernames and passwords. They should have a proper termination process so that keys are removed when no longer needed.	
<b>Task 1: Create an SSH Key Pair for User Authentication</b> 1. The simplest way to generate a key pair is to run <i>ssh-keygen</i> without arguments. In this case, it will prompt for the file in which to store keys. First,	

the tool asked where to save the file. SSH keys for user authentication are usually stored in the users `.ssh` directory under the home directory. However, in enterprise environments, the location is often different. The default key file name depends on the algorithm, in this case `id_rsa` when using the default RSA algorithm. It could also be, for example, `id_dsa` or `id_ecdsa`.

2. Issue the command `ssh-keygen -t rsa -b 4096`. The algorithm is selected using the `-t` option and key size using the `-b` option.
3. When asked for a passphrase, just press enter. The passphrase is used for encrypting the key, so that it cannot be used even if someone obtains the private key file. The passphrase should be cryptographically strong.
4. Verify that you have created the key by issuing the command `ls -la .ssh`. The command should show the `.ssh` directory containing a pair of keys. For example, `id_rsa.pub` and `id_rsa`.

```
vboxuser@workstation:~$ ssh-keygen -t rsa -b 4096
Generating public/private rsa key pair.

Enter file in which to save the key (/home/vboxuser/.ssh/id_rsa): Enter pass
ase (empty for no passphrase):
Enter same passphrase again:
Your identification has been saved in /home/vboxuser/.ssh/id_rsa
Your public key has been saved in /home/vboxuser/.ssh/id_rsa.pub
The key fingerprint is:
SHA256:JkbbkRgsbbXCbPKMc3utwLj+/ZcMts5MD0M0WSNyp+yM vboxuser@workstation
The key's randomart image is:
+----[RSA 4096]-----+
|  .+**+  . |
|  . =0=. + |
| 0 +.==+  . |
|  + 000 +  |
|    000S   |
|  . 0.0+  . |
|    =  oB.. |
|  . + E0*=  |
|    o.000.+ |
+----[SHA256]-----+
vboxuser@workstation:~$ ls -la ~/.ssh
total 24
drwx----- 2 vboxuser vboxuser 4096 Sep 10 18:26 .
drwxr-x--- 15 vboxuser vboxuser 4096 Aug 25 18:36 ..
-rw----- 1 vboxuser vboxuser 3389 Sep 10 18:26 id_rsa
-rw-r--r-- 1 vboxuser vboxuser 746 Sep 10 18:26 id_rsa.pub
```

## Task 2: Copying the Public Key to the remote servers

1. To use public key authentication, the public key must be copied to a server and installed in an `authorized_keys` file. This can be conveniently done using the `ssh-copy-id` tool.
2. Issue the command similar to this: `ssh-copy-id -i ~/.ssh/id_rsa user@host`

3. Once the public key has been configured on the server, the server will allow any connecting user that has the private key to log in. During the login process, the client proves possession of the private key by digitally signing the key exchange.
4. On the local machine, verify that you can SSH with Server 1 and Server 2. What did you notice? Did the connection ask for a password? If not, why?

```
vboxuser@workstation:~$ ssh vboxuser@192.168.31.133
Welcome to Ubuntu 22.04.4 LTS (GNU/Linux 6.8.0-40-generic x86_64)

```

### Reflections:

Answer the following:

1. How will you describe the ssh-program? What does it do?

SSH (Secure Shell) is a protocol and program used for secure communication between a local and a remote machine. It enables users to log in and execute commands on a remote system, ensuring that all data transmitted is encrypted to protect against eavesdropping and tampering. `ssh` is commonly used for secure remote administration, file transfers, and tunneling.

2. How do you know that you already installed the public key to the remote servers?

You can verify that the public key is installed on the remote server by attempting to SSH into the server without being prompted for a password. Additionally, you can check the `authorized_keys` file on the remote server to see if your public key is

listed there. Running the `ssh -v user@host` command provides verbose output and helps confirm whether key-based authentication is being used.

## Part 2: Discussion

*Provide screenshots for each task.*

It is assumed that you are done with the last activity (**Activity 2: SSH Key-Based Authentication**).

### Set up Git

At the heart of GitHub is an open-source version control system (VCS) called Git. Git is responsible for everything GitHub-related that happens locally on your computer. To use Git on the command line, you'll need to download, install, and configure Git on your computer. You can also install GitHub CLI to use GitHub from the command line. If you don't need to work with files locally, GitHub lets you complete many Git-related actions directly in the browser, including:

- Creating a repository
- Forking a repository
- Managing files
- Being social

### Task 3: Set up the Git Repository

1. On the local machine, verify the version of your git using the command *which git*. If a directory of git is displayed, then you don't need to install git. Otherwise, to install git, use the following command: *sudo apt install git*

```
vboxuser@workstation:~$ sudo apt install git
[sudo] password for vboxuser:
Reading package lists... Done
Building dependency tree... Done
Reading state information... Done
The following packages were automatically installed and are no longer requ
  libwpe-1.0-1 libwpebackend-fdo-1.0-1
Use 'sudo apt autoremove' to remove them.
The following additional packages will be installed:
  git-man liberror-perl
Suggested packages:
  git-daemon-run | git-daemon-sysvinit git-doc git-email git-gui gitk gitw
  git-cvs git-mediawiki git-svn
The following NEW packages will be installed
  git git-man liberror-perl
0 to upgrade, 3 to newly install, 0 to remove and 6 not to upgrade.
Need to get 4,146 kB of archives.
After this operation, 21.0 MB of additional disk space will be used.
Do you want to continue? [Y/n] y
Get:1 http://ph.archive.ubuntu.com/ubuntu jammy/main amd64 liberror-perl a
17029-1 [26.5 kB]
Get:2 http://ph.archive.ubuntu.com/ubuntu jammy-updates/main amd64 git-man
1:2.34.1-1ubuntu1.11 [955 kB]
Get:3 http://ph.archive.ubuntu.com/ubuntu jammy-updates/main amd64 git amd
2.34.1-1ubuntu1.11 [3,165 kB]
```

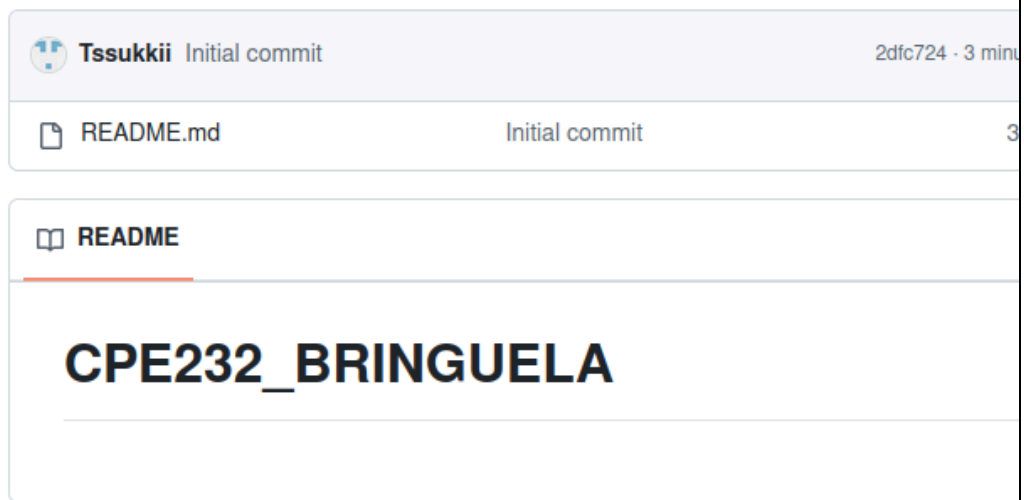

2. After the installation, issue the command *which git* again. The directory of git is usually installed in this location: *user/bin/git*.

```
vboxuser@workstation:~$ which git
/usr/bin/git
```

3. The version of git installed in your device is the latest. Try issuing the command *git --version* to know the version installed.

```
vboxuser@workstation:~$ git --version
git version 2.34.1
```

4. Using the browser in the local machine, go to [www.github.com](https://www.github.com).
5. Sign up in case you don't have an account yet. Otherwise, login to your GitHub account.
  - a. Create a new repository and name it as CPE232\_yourname. Check Add a README file and click Create repository.

- b. Create a new SSH key on GitHub. Go your profile's setting and click ASSH and GPG keys. If there is an existing key, make sure to delete it. To create a new SSH keys, click New SSH Key. Write CPE232 key as the title of the key.

A screenshot of the 'Add new SSH Key' form on GitHub. The form has three sections: 'Title', 'Key type', and 'Key'. The 'Title' section has a text input field with 'CPE232' entered. The 'Key type' section has a dropdown menu with 'Authentication Key' selected. The 'Key' section has a large text area with placeholder text: 'Begins with 'ssh-rsa', 'ecdsa-sha2-nistp256', 'ecdsa-sha2-nistp384', 'ecdsa-sha2-nistp521', 'ed25519', 'sk-ecdsa-sha2-nistp256@openssh.com', or 'sk-ssh-ed25519@openssh.com''. At the bottom of the form, there is a green button labeled 'Add SSH key'.

- c. On the local machine's terminal, issue the command `cat .ssh/id_rsa.pub` and copy the public key. Paste it on the GitHub key and press Add SSH key.

This is a list of SSH keys associated with your account. Remove any keys that you do not recognize.

### Authentication keys

#### CPE232

SHA256: JkbbRgsbbXCBPKMc3utwLj+/ZcMts5MD0M0WSNyp+yM

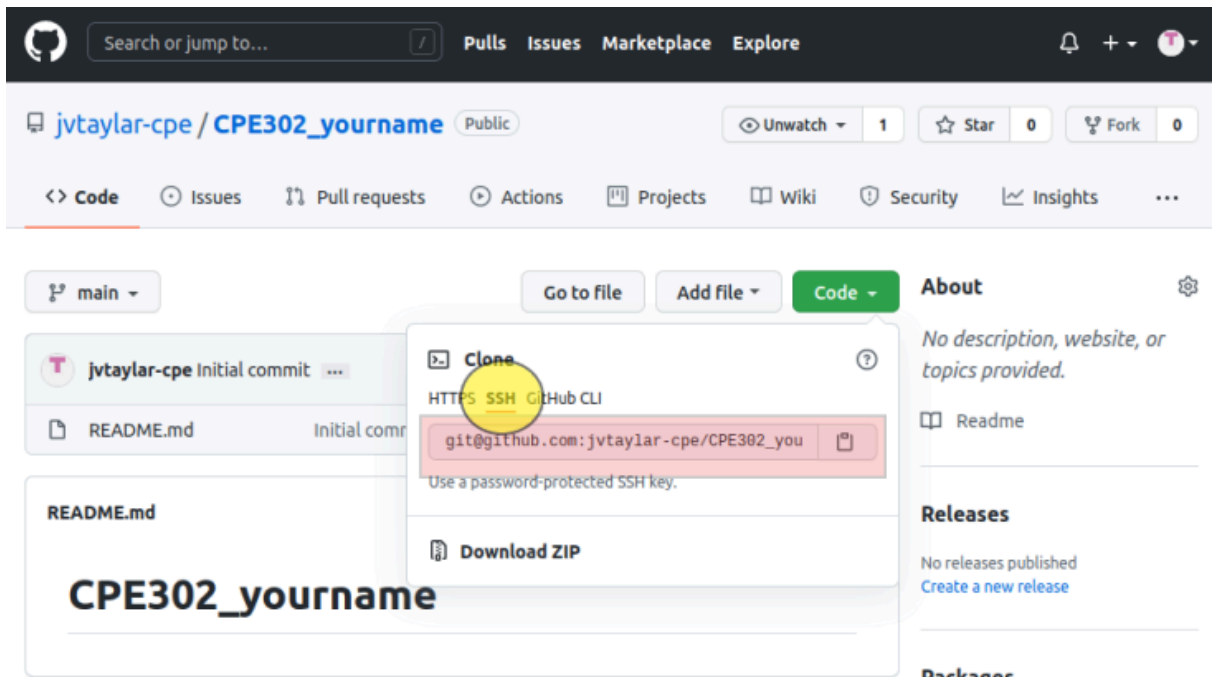

Added on Sep 10, 2024

Never used — Read/write

SSH

Check out our guide to [connecting to GitHub using SSH keys](#) or troubleshoot [common SSH problems](#).

- d. Clone the repository that you created. In doing this, you need to get the link from GitHub. Browse to your repository as shown below. Click on the Code drop down menu. Select SSH and copy the link.

- e. Issue the command `git clone` followed by the copied link. For example, `git clone git@github.com:jvtaylor-cpe/CPE232\_yourname.git`. When prompted to continue connecting, type yes and press enter.

```
vboxuser@workstation:~$ git clone git@github.com:Tssukkii/CPE232_BRINGUELA.git
Cloning into 'CPE232_BRINGUELA'...
The authenticity of host 'github.com (20.205.243.166)' can't be established.
ED25519 key fingerprint is SHA256:+DiY3wvV6TuJJhbpZisF/zLDA0zPMSvHc
This key is not known by any other names
Are you sure you want to continue connecting (yes/no/[fingerprint]): yes
Warning: Permanently added 'github.com' (ED25519) to the list of known hosts.

vboxuser@workstation:~$
```

- f. To verify that you have cloned the GitHub repository, issue the command `ls`. Observe that you have the CPE232\_yourname in the list of your directories. Use CD command to go to that directory and LS command to see the file README.md.

```
vboxuser@workstation:~$ ls
CPE232_BRINGUELA  Documents  Music      Public  Templates
Desktop           Downloads  Pictures   snap    Videos
vboxuser@workstation:~$
```

- g. Use the following commands to personalize your git.
- `git config --global user.name "Your Name"`
  - `git config --global user.email yourname@email.com`
  - Verify that you have personalized the config file using the command `cat ~/.gitconfig`

```
vboxuser@workstation:~$ git config --global user.name "Tracey Dee Bringuela"
vboxuser@workstation:~$ git config --global user.email "qtdbbringuela@tip.edu.ph"
vboxuser@workstation:~$ cat ~/.gitconfig
[user]
  name = Tracey Dee Bringuela
  email = qtdbbringuela@tip.edu.ph\n
```

- h. Edit the README.md file using nano command. Provide any information on the markdown file pertaining to the repository you created. Make sure to write out or save the file and exit.

```
GNU nano 6.2                                README.md *
